

# Testing sffamily, ttfamily, rmfamily.

Carlos Valdez

June 24, 2019

## 1 Introduction

In this document I use some basic L<sup>A</sup>T<sub>E</sub>X declarations that affect the whole text when *they are declare at least once*.

These declarations are: *sffamily*, *ttfamily*, *rmfamily*.

The following text was taken from `www.openvpn.net`.

## 2 OpenVpn (text sample)

**OpenVPn** is a full featured open source SSL VPN solution that accommodates a wide range of configurations, including remote access, site to site VPNs. Wi-Fi security, and enterprise scale remote access solutions with load balancing fallover and fine grained access controls.

OpenVpn offers a cost effective lightweight alternative to other VPN technologies making it the best solution for small to medium enterprises.

## 3 Conclusion

Two paragraph were printed with two different fonts and here I return to the default font.

The difference between commands and declarations in L<sup>A</sup>T<sub>E</sub>X are that commands need arguments in braces and only affect the text in braces, but declarations do not use braces and affect the text from the point you use them onwards.
